

Pasture & Grass Hay Stand Establishment

Steps to Boost Stand Establishment

Determine Soil Needs

Pasture and grass hay production starts with soil preparation. AgroVantage[®] soil testing with Midwest Labs will provide you with a field-by-field recommendation for proper pH and fertilization.

Prepare the Soil with Soil X-CYTO[®] and WEX[®]

Soil X-CYTO[®], enables plants to use nutrients more efficiently at key growth stages. The results are faster more vigorous plant growth, setting the stage for increased yields and superior quality.

WEX[®] stimulates root development, improving water and nutrient absorption leading to increased root mass, higher organic matter and higher yields.

Boost your stand with Amplify[®]

Choose Amplify D[®] or Amplify L[®] to enhance seedling vigor and aid in establishing a good stand. Amplify provides an extra energy source to fuel the growth of healthy, productive plants. Seeds will better survive stressful, cold/wet or hot/dry conditions.

This program will:

- Determine fertilization and pH adjustment needs
- Fuel faster seedling growth and promote seed performance
- Generate faster development for greater resistance to stress
